Illicit drug markets have global dimensions and require coordinated responses on a comparable scale. In this context, the World Drug Report aims to improve understanding of the illicit drug problem and contribute to more international cooperation for countering it. This year’s edition begins with an overview of recent trends and the current situation in terms of production, trafficking and consumption and the consequences of illicit drug use in terms of treatment, drug-related diseases and drug-related deaths. The second chapter presents a long-term perspective: it looks at the main characteristics of the contemporary drug problem, the ways it has changed over the last few decades, the driving factors that shaped this evolution, and the directions it is likely to take in the future.

World Drug Report
2012
About 230 million people, or 5 per cent of the world’s adult population, are estimated to have used an illicit drug at least once in 2010. Problem drug users number about 27 million, which is 0.6 per cent of the world adult population. Throughout the world, illicit drug use appears to be generally stable, though it continues to be rising in several developing countries. Heroin, cocaine and other drugs kill around 0.2 million people each year, shattering families and bringing misery to thousands of other people. Illicit drugs undermine economic and social development and contribute to crime, instability, insecurity and the spread of HIV.

Global opium production amounted to 7,000 tons in 2011. That is more than a fifth less than the peak of 2007 but an increase from the low level of 2010, the year in which a plant disease destroyed almost half of the opium harvest in Afghanistan, which continues to be the world’s biggest producer. The total area under coca bush cultivation in the world fell by 18 per cent between 2007 and 2010 and by 33 per cent since 2000. Efforts to reduce cultivation and production of the main plant-based problem drugs have, however, been offset by rising levels of synthetic drug production, including significant increases in the production and consumption of psychoactive substances that are not under international control.

Although Member States are to be commended for their hard work in dealing with the drug problem, often with the support of UNODC, the figures sketched above indicate the scale of the challenge. The response by UNODC has been twofold: first, develop an integrated approach; and second, focus on prevention, treatment, alternative development and the promotion of fundamental human rights.

**Developing an integrated approach**

Drug trafficking flows have global dimensions. The flows link regions and continents, sometimes with dramatic consequences for the countries they affect. Our research and trend analysis is designed to improve understanding of those issues. The results are fed into integrated programmes to reduce illicit drug supply and demand.

UNODC is building integrated regional programmes, as well as promoting interregional and inter-agency responses. One such inter-agency approach is the United Nations system Task Force on Transnational Organized Crime and Drug Trafficking, established in 2011.

In December 2011, the UNODC Regional Programme for Afghanistan and Neighbouring Countries was launched. To support this programme, UNODC and its partners have created cross-border, intelligence and precursor control initiatives to share information and experience and to conduct joint operations. All these regional initiatives are interlinked with existing law enforcement networks.

There are also new initiatives for countering money-laundering and for coupling law enforcement with alternative livelihoods. An initiative has been launched to disrupt drug trafficking by sea in West and South Asia. UNODC has also launched a new Regional Programme for South-Eastern Europe to focus action on areas where heroin flowing along the Balkan route enters Europe.

A regional hub for Central America and the Caribbean has been developed in Panama. The strengthened UNODC Regional Office for Mexico and countries in that region will be linked to the hub. In the Dominican Republic and Mexico, centres of excellence are being established to promote drug demand reduction.

A network of prosecutors in Central America is using best practices to strengthen criminal justice in the region. At the same time, the Container Control Programme is expanding, operating in more countries and controlling containers transported by sea, as well as by air. In West and Central Africa, successes are being achieved through the establishment of transnational crime units.

In South-East Asia, UNODC provides the groundwork for cross-border cooperation between the countries of the Greater Mekong subregion, helps secure sustainable livelihoods through alternative development schemes and gives countries an evidence base for taking action against the interrelated threats of organized crime and drug trafficking.

UNODC is also improving capacities to counter money-laundering and corruption in all regions by interrupting the flow of illicit drug proceeds, which are used by criminal networks to carry out further criminal activities.

**Rebalancing drug control policy through alternative development, prevention, treatment and fundamental human rights**

UNODC will continue to build international cooperation and to help Member States respond to these threats. If we are to confront these challenges, however, both supply and demand need to be reduced. There is growing recognition that treatment and rehabilitation of illicit drug users are more effective than punishment.

Of course, this does not mean abandoning law enforcement activities; instead, the supply and demand sides need to complement each other. This means balancing our efforts against drug trafficking with alternative development programmes for farmers and helping drug users to be rehabilitated and reintegrated into society.

Alternative development is the key to reducing illicit drug
crop cultivation and drug production. At present, only around one quarter of all farmers involved in illicit drug crop cultivation worldwide have access to development assistance. If we are to offer new opportunities and genuine alternatives, this needs to change.

UNODC is also promoting activities that significantly reduce illicit drug demand. Such activities are necessary because of growing signs of drug use in the so-called transit countries. For example, there are increasing numbers of cocaine users in West and Central Africa; and the highest prevalence rates for opium and heroin use are in Afghanistan and the Islamic Republic of Iran.

Drug control means restoring the balance and paying greater attention to the health side by reducing overdoses, psychiatric problems and the incidence of infections such as HIV and hepatitis. Prevention, treatment, rehabilitation and health all have to be recognized as key elements in the global strategy to reduce drug demand. To support its activities, UNODC takes an approach based on human rights, the international drug control conventions and international standards and norms.

Moving forwards not backwards

Recently several countries facing high rates of violence, kidnapping, corruption and human trafficking related to transnational organized crime and drug trafficking have called for international assistance. These countries need our support. It is our shared responsibility to do everything possible to help.

In doing so, we need to be equally clear about the importance of the international conventions on drugs, organized crime and corruption. Indeed, almost everything mentioned in this preface — focusing on drug demand, rehabilitation and reintegration, alternative development, shared responsibility and fundamental human rights — are underscored in the conventions.

The Commission on Narcotic Drugs put this succinctly when, in its resolution 55/3, on the 100th anniversary of the International Opium Convention, it expressed its determination to strengthen action and cooperation at the national, regional and international levels towards the goals of the international drug control conventions, which remain the cornerstone of the international drug control system. Our direction is guided by the international conventions on drug control and crime prevention. We need to move as one; if not, we risk going backwards, not forwards.

Yury Fedotov
Executive Director

Editorial and production team

The World Drug Report 2012 was produced under the supervision of Sandeep Chawla, UNODC Deputy Executive Director and Director, Division for Policy Analysis and Public Affairs

Core team

Laboratory and Scientific Section
Justice Tettey, Alice Hamilton, Beate Hammond and Sabrina Levissianos.

Statistics and Surveys Section

Studies and Threat Analysis Section

The production of the World Drug Report 2012 was coordinated by the Studies and Threat Analysis Section.

The report also benefited from the work and expertise of many other UNODC staff members in Vienna and around the world.
The boundaries and names shown and the designations used on maps do not imply official endorsement or acceptance by the United Nations. A dotted line represents approximately the line of control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Disputed boundaries (China/India) are represented by cross hatch due to the difficulty of showing sufficient detail.

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Countries and areas are referred to by the names that were in official use at the time the relevant data were collected.

All references to Kosovo in the present publication should be understood to be in compliance with Security Council resolution 1244 (1999).

Since there is some scientific and legal ambiguity about the distinctions between “drug use”, “drug misuse” and “drug abuse”, the neutral terms “drug use” and “drug consumption” are used in this report.

The following symbols have been used in the tables throughout the report:

Two dots (..) indicate that data are not available or are not separately reported.

References to dollars ($) are to United States dollars, unless otherwise stated.

References to “tons” are to metric tons, unless otherwise stated.

The following abbreviations have been used in this Report:

- AIDS: acquired immunodeficiency syndrome
- ATS: amphetamine-type stimulant
- BZP: N-benzylpiperazine
- CICAD: Inter-American Drug Abuse Control Commission (Organization of American States)
- mCPP: m-chlorophenylpiperazine
- DEA: Drug Enforcement Administration (United States of America)
- EMCDDA: European Monitoring Centre for Drugs and Drug Addiction
- Europol: European Police Office
- FARC: Revolutionary Armed Forces of Colombia
- GDP: gross domestic product
- ha: hectare
- HIV: human immunodeficiency virus
- INTERPOL: International Criminal Police Organization
- IRA: Irish Republican Army
- LSD: lysergic acid diethylamide
- MDA: methylenedioxymethamphetamine
- MDE: methylenedioxymethylamphetamine
- MDMA: methylenedioxymethamphetamine
- 3,4-MDP-2-P: 3,4-methylenedioxyphenyl-2-propanone
- MDPV: methylenedioxyamphetamine
- 4-MMC: 4-methylmethcathinone
- OECD: Organisation for Economic Co-operation and Development
- P-2-P: 1-phenyl-2-propanone
- PKK: Kurdistan Workers’ Party
- PMK: piperonyl methyl ketone
- SIM: subscriber identity module
- SMS: short message service
- THC: tetrahydrocannabinol
- WHO: World Health Organization
Chapter I of this year’s World Drug Report provides an overview of recent trends and the drug situation in terms of production, trafficking and consumption and the consequences of illicit drug use in terms of treatment, drug-related diseases and drug-related deaths.

Chapter II presents a long-term perspective on the characteristics and evolution of the drug problem and the main factors that shaped it. It starts with a discussion of the main characteristics of the contemporary drug problem, followed by an overview of the shifts observed over the last few decades, before concluding with an analysis of the driving factors that shaped the evolution of the drug problem, including a brief outlook for its likely future direction.

CHAPTER I. RECENT STATISTICS AND TREND ANALYSIS OF ILICIT DRUG MARKETS

Latest available data indicate that there has been no significant change in the global status quo regarding the use, production and health consequences of illicit drugs, other than the return to high levels of opium production in Afghanistan after a disease of the opium poppy and subsequent crop failure in 2010. But while the troubled waters of the world’s illicit drug markets may appear to be stagnant, shifts and changes in their flows and currents can be observed below the surface. These are significant and also worrying, not because of how they currently impact on the data but because they are proof of the resilience and adaptability of illicit drug suppliers and users and because of the potential future repercussions of those shifts and changes in the world’s major drug markets.

The global picture

The extent of global illicit drug use remained stable in the five years up to and including 2010, at between 3.4 and 6.6 per cent of the adult population (persons aged 15-64). However, some 10-13 per cent of drug users continue to be problem users with drug dependence and/or drug-use disorders, the prevalence of HIV (estimated at approximately 20 per cent), hepatitis C (46.7 per cent) and hepatitis B (14.6 per cent) among injecting drug users continues to add to the global burden of disease, and, last but not least, approximately 1 in every 100 deaths among adults is attributed to illicit drug use.

Opioids continue to be the dominant drug type accounting for treatment demand in Asia and Europe and also contribute considerably to treatment demand in Africa, North America and Oceania. Treatment for cocaine use is mainly associated with the Americas, while cannabis is the main drug causing treatment demand in Africa. Demand for treatment relating to the use of amphetamine-type stimulants (ATS) is most common in Asia.

Globally, the two most widely used illicit drugs remain cannabis (global annual prevalence ranging from 2.6 to 5.0 per cent) and ATS, excluding "ecstasy", (0.3-1.2 per cent) but data relating to their production are scarce. Total production and cultivation of coca is known to be stable, while the production of opium has returned to levels comparable to 2009. Global annual prevalence of both cocaine and opiates (opium and heroin) has remained stable, with ranges from 0.3-0.4 per cent and 0.3-0.5 per cent, respectively, of the adult population aged 15-64:

### Opioids

With estimated annual prevalence ranging from 0.6 to 0.8 per cent of the population aged 15-64, the use of opioids (mainly heroin, morphine and non-medical use of prescription opioids) is stable in all of the main markets. After a blip in global production in 2010, caused by a disease of the opium poppy in Afghanistan, production has now more or less returned to its 2009 level. Average wholesale and retail prices in the most regularly monitored markets for opiates, in Western and Central Europe and the Americas, have also shown little change since 2009, but this does not reflect the situation seen in such major opium-producing countries as Afghanistan and Myanmar where, despite an increase in opium production, farm-gate prices continued to rise in 2010 and 2011.

The latter may imply that illicit demand for opium and its derivatives is continuing to increase in spite of the recent recovery of opium production. While it is difficult to identify one specific reason for this, it could be an underestimation of global heroin consumption, especially in countries in Asia that are major markets and countries in Africa that are possible emerging markets, or to an expansion in the market for raw opium (not processed into heroin), which could feed increased opium consumption and, perhaps, a parallel illicit market for opiates such as morphine. High prices at source could also be explained by speculation in the local market.
It is too early to know exactly the impact of the 2010 opium crop failure in Afghanistan on the major illicit markets for opiates, but a general decrease in seizures in 2010 occurred in most of the countries supplied by Afghan opiates and a heroin shortage was observed in some European countries in 2010-11. There are indications that this shortage has encouraged users in some countries to replace heroin with other substances such as desomorphine (also known as “krokodil”), acetylated opium (known as “kompot”) and synthetic opioids such as fentanyl and buprenorphine.

Although large quantities of heroin continue to be trafficked along the main Balkan route, leading from Afghanistan to Western and Central Europe via South-Eastern Europe, declining seizures were reported in most of the countries in those regions in 2010. However, the coastal markets of Africa are reporting increasing seizures, as are countries in South-East Asia. Whether this implies that traffickers are seeking alternative routes or that heroin use is on the increase in those places, the lack of available data makes it impossible to draw definitive conclusions. But one thing is clear: the opiate market continues to be extremely flexible and adaptable.

Cocaine

The general stability of global cocaine use and manufacture masks different trends in different regions and countries. Available data on cultivation, yield and trafficking indicate that there has been an overall decline in global manufacture of cocaine, prompted by a major decline in cocaine manufacture in Colombia in the five-year period 2006-2010. A sizeable shift has taken place as coca bush cultivation and coca production increased in the same period in the other two coca-producing countries, Bolivia (Plurinational State of) and Peru, which are becoming increasingly important producers.

The major markets for cocaine continue to be in North America, Europe and Oceania (mainly Australia and New Zealand). North America has seen a marked decline in cocaine use, mainly due to a decline in the United States, from 3.0 per cent (2006) to 2.2 per cent (2010) among adults aged 15-64; however, there has not been such a decline in Europe, where cocaine use stabilized over the same period. Latest data from Australia show an increase in cocaine use.

There is evidence that, while the United States market continued to be almost exclusively supplied by cocaine produced in Colombia, from 2006 there was a shift in the European markets, which compensated, at least partially, for the shortage of cocaine produced in Colombia with cocaine produced in Bolivia (Plurinational State of) and Peru. The decline in seizures in Europe, despite the apparent stability of the region’s cocaine supply, implies that a change in trafficking modes is occurring as traffickers may be making increasing use of containers. In the United States of America, the decrease in availability of cocaine has been reflected by rising prices since 2007. In Europe, however, no dramatic changes in prices have been observed since 2007. Overall, they remained at the same level in dollar terms between 2007 and 2010 and even decreased in some countries.

An additional factor influencing the availability of, and overall demand for, cocaine in different regions is the emergence of new, albeit small, cocaine markets in, for example, Eastern Europe and South-East Asia. There is also some evidence that cocaine trafficking through West Africa may have had a spillover effect on countries in that subregion, with cocaine emerging as a drug of major concern, along with heroin. Some data indicate an expansion of the cocaine market, particularly of “crack” cocaine, in some countries of South America.

Amphetamine-type stimulants

The illicit manufacture of ATS (mainly methamphetamine, amphetamine and “ecstasy”), the second most widely used class of drugs worldwide, is difficult to measure because it is widespread and often on a small scale. While the use and global seizures of ATS remained largely stable, 2010 was marked by an increase in methamphetamine seizures to more than double the amount in 2008, partly due to seizures increasing in Central America and East and South-East Asia. For the first time since 2006, global methamphetamine seizures surpassed global amphetamine seizures, which fell by 42 per cent (to 19.4 tons) mainly as a result of a decrease in seizures in the Near and Middle East and South-West Asia.

Despite a significant rise in the dismantling of clandestine amphetamine laboratories, amphetamine seizures in Europe continued their downward trend, reaching their lowest level since 2002 (5.4 tons). There are signs, however, of a recovery in the European “ecstasy” market, with seizures of “ecstasy”-group substances more than doubling (from 595 kg in 2009 to 1.3 tons in 2010). The drug’s availability and use also appear to be on the increase in the United States, while there has also been an increase in “ecstasy” seizures in Oceania and South-East Asia.

There is also growing evidence to suggest that criminal organizations involved in smuggling ATS, particularly methamphetamine, exploit West Africa in a similar way to cocaine traffickers. Seizures of methamphetamine from West Africa started to increase in 2008; the substance was being smuggled into East Asian countries, predominantly Japan and the Republic of Korea.

Cannabis

Cannabis is the world’s most widely used illicit substance: there are between 119 million and 224 million cannabis users worldwide, and consumption is stable. Cannabis seizure and eradication data suggest that the production of cannabis herb (marijuana) is increasingly widespread, but the often localized, small-scale nature of cannabis cultivation and production make it very difficult to assess. New
data on larger-scale global production of cannabis resin (hashish) are only available for Afghanistan.

The relative importance of cannabis resin and herb varies by region, with cannabis resin being dominant in the Near and Middle East and South-West Asia, cannabis resin and herb markets being comparable in size in North Africa and Europe. The rest of the world, including the United States, where production continues to be high, is dominated by cannabis herb. Data for Africa is hard to come by but seizure data suggest that herb is also the dominant form of cannabis in that region, except in North Africa where resin is predominant.

The production of cannabis resin is assumed to be very small in Europe yet the region is the world’s biggest market for cannabis resin and North Africa has long been Europe’s predominant supplier. Most of the North African cannabis resin consumed in Europe traditionally comes from Morocco, but recent data show that that country’s relative importance as a supplier could be on the wane. Indeed, Afghanistan now appears to be one of the most important countries worldwide in terms of cannabis resin production.

The proliferation of indoor cannabis cultivation sites and differing trends in prices and seizures of cannabis herb and resin indicate that there may be a shift in the European cannabis market away from the dominance of resin towards herb, with most European Union member States reporting the cultivation of cannabis herb to be a phenomenon that appears to be on the increase.1 Though usually small-scale, indoor cultivation sites may also include major operations run by organized criminal groups who often choose to supply local markets in order to reduce the risks involved in cannabis trafficking.

Furthermore, the rise in indoor cultivation of cannabis is often related to an increase in cannabis potency, which is reflected in the data only to a limited extent. Such increases in potency may explain, in part at least, the increase in treatment demand among cannabis users, though this may also be related to the cumulative effects of prolonged use of cannabis.

Beyond the traditional “highs”: new substances and the non-medical use of prescription pharmaceuticals

Global figures for the non-medical use of prescription drugs other than opioids and amphetamines are not available. Nevertheless, this is reportedly a growing health problem, with prevalence rates higher than for numerous controlled substances in many countries. In the United States, for example, lifetime, annual and monthly prevalence of non-medical use of psychotherapeutics (mostly pain relievers) among persons aged 12 and over was reported as 20.4, 6.3 and 2.7 per cent, respectively, for 2010,2 higher rates than for any drug other than cannabis. And while illicit drug use among males in general greatly exceeds that among females, the non-medical use of tranquillizers and sedatives among females, in those countries where data are available (in South America, Central America and Europe), is a notable exception to the rule (and exceeds the use of cannabis).3 There is also evidence that these substances are increasingly being used in combination with more traditional illicit substances, in polydrug use designed to either enhance or counterbalance their effects.

New chemically engineered psychotropic substances designed to remain outside international control are also increasingly being used and identified. Numerous countries in all regions, particularly Europe, North America and Oceania, reported the use of such substances as an emerging trend in 2010. The most notable of these substances included the methcathinone analogue 4-methylmethcathinone (also known as mephedrone), and methylenedioxyprovalerone (MDPV), which are often sold as “bath salts” or “plant food” and used as substitutes for controlled stimulants such as cocaine or “ecstasy”. Similarly, piperazine derivatives4 are also being sold as substitutes for “ecstasy”, while several synthetic cannabinoids that emulate the effect of cannabis but contain uncontrolled products have been detected since 2008 in herbal smoking blends.

Drug trafficking organizations continue to adapt their manufacturing strategies in order to avoid detection, and such changes in the illicit manufacturing process of synthetic substances present new challenges to drug control authorities worldwide.

Data challenges

Considerable challenges also remain in the reporting of trend data on illicit drug use, production and trafficking. The main challenges continue to be the availability and reporting of data on different aspects of illicit drug demand and supply in Member States. The lack of data is particularly acute in Africa and parts of Asia, where data on the prevalence of illicit drug use and trends remain vague at best. Other aspects such as prices and purity of drugs, seizures and trafficking patterns and methodological difficulties in estimating in some regions the illicit production of substances — particularly cannabis and ATS — make it difficult to analyse and present a complete picture of the

2 United States of America, Department of Health and Human Services, Substance Abuse and Mental Health Services Administration, Results from the 2010 National Survey on Drug Use and Health: Summary of National Findings. NSDUH Series H-41, HHS Publication No. SMA 11-4658 (Rockville, Maryland, 2011).

3 In fact, monthly prevalence of tranquilizer use among females in South America (1.3 per cent) and Europe (4.2 per cent) is greater than annual prevalence of the use of cannabis among females in South America (1.0 per cent) or Europe (3.5 per cent).

4 These include N-benzylpiperazine (BZP) and 3-trifluoromethylphenylpiperazine.
chapter ii. the contemporary drug problem: characteristics, patterns and driving factors

what are the fundamental characteristics of the contemporary illicit drug problem

while psychoactive substances have been consumed for thousands of years, the drug problem has developed some key characteristics over the last few decades, against a backdrop of rapid socioeconomic transitions in a number of countries. illicit drug use is now characterized by a concentration among youth — notably young males living in urban environments — and an expanding range of psychoactive substances. although established illicit drug markets in many developed countries have shown signs of stabilization, the growth of drug use seems to continue in many developing countries.

while illicit drug production, trafficking and use remain issues of concern, the international drug control system appears to have kept the consumption of illegal drugs well below the levels reported for legal psychoactive substances. global estimates suggest that past-month prevalence of tobacco use (25 per cent of the population aged 15 and above) is 10 times higher than past-month prevalence of illicit drug use (2.5 per cent). annual prevalence of the use of alcohol is 42 per cent (the use of alcohol being legal in most countries), which is eight times higher than annual prevalence of illicit drug use (5.0 per cent). heavy episodic weekly drinking is eight times more prevalent than problem drug use. drug use accounts for 0.9 per cent of all disability-adjusted life years lost at the global level, or 10 per cent of all life years lost as a result of the consumption of psychoactive substances (drugs, alcohol and tobacco).

drug consumption levels would likely be higher without an age-containment effect at work. the international drug control system seems to be acting as a brake on drug use, particularly among adults who are less willing to transgress laws by consuming drugs. while the initiation of psychoactive substance use typically occurs during the teens or early years of adulthood, the (legal) use of tobacco and alcohol continues in much larger proportions with age in the same population groups. the use of khat — which is legal in a number of countries — shows the same patterns. while the prevalence of khat use in yemen among persons aged 61 and above is just 13 per cent lower than among those in the age group 21-30, the use of cannabis in the united states is some 93 per cent lower among those aged 61 and above than among those aged 21-30. in other words, the use of legal psychoactive substances tends to be far more homogeneously distributed across age groups than the use of illegal drugs.

there is also a pronounced gender gap in relation to illicit drug consumption, with use levels among females significantly lower than among males in nearly all countries for which solid gender-disaggregated data are available. in the united states, characterized by a small gender gap, female drug use is about two thirds that of males, whereas in some other countries, including india and indonesia, female drug use is as low as one tenth that of males, though there is a risk that female drug use may be underreported. there are some signs, however, that the gender gap may be diminishing in some highly mature illicit drug markets, particularly among young people. nonetheless, the overrepresentation of males among drug users, which is confirmed by household surveys, workforce drug tests, treatment data, arrest statistics and other relevant information, is still a salient feature of drug use patterns.

what is the impact on society

one of the key impacts of illicit drug use on society is the negative health consequences experienced by its members. drug use also puts a heavy financial burden on society. expressed in monetary terms, some us$ 200 billion–250 billion (0.3–0.4 per cent of global gdp) would be needed to cover all costs related to drug treatment worldwide. in reality, the actual amounts spent on treatment for drug abuse are far lower — and less than one in five persons who needs such treatment actually receives it.

the impact of illicit drug use on a society’s productivity — in monetary terms — seems to be even larger. a study in the united states suggested that productivity losses were equivalent to 0.9 per cent of gdp, and studies in several other countries showed losses equivalent to 0.3–0.4 per cent of gdp.

the costs associated with drug-related crime are also substantial. in the united kingdom of great britain and northern ireland, a study suggested that the costs associated with drug-related crime (fraud, burglary, robbery and shoplifting) in england and wales were equivalent to 1.6 per cent of gdp, or 90 per cent of all the economic and social costs related to drug abuse.

how have the patterns of the drug problem shifted over time

while several of the overall characteristics have remained relatively constant over the last few decades, the patterns of illicit drug production, trafficking and use have, nonetheless, shifted significantly.

the illicit market for opiates — the most problematic type of drugs — clearly declined over the last century. licit and illicit production of opium (including in the form of poppy
straw) fell by some three quarters between 1906/07 and 2010. The decline mainly took place in the first half of the twentieth century. Global opium production levels increased again until 2000, and remained basically stable thereafter. While consumption of opiates has stabilized or declined over the past decade in Western Europe (for a long time, the key market for heroin consumption), developments in other markets have been mixed.

The global cocaine market, in contrast, has expanded since the late nineteenth century and has only recently been showing some signs of decline. Global production of cocaine increased sharply in the 1980s and the 1990s and has only stabilized over the past decade. In recent years, however, the amounts of cocaine available for consumption — after deducting seizures made along the trafficking routes — appear to have declined. Cocaine consumption in North America, the region with the largest cocaine market, has declined significantly over the past decade, though that decrease has been partially offset by rising consumption in Europe and South America.

Cannabis was and continues to be the world’s most widespread illicit drug. While cannabis use is stable or declining in several developed countries, it is still increasing in many developing ones. Hydroponic cannabis cultivation, often indoors, is now common in many developed countries. The result has been a more potent drug as well as shorter supply lines and a reduced need for interregional trafficking.

Illicit manufacture and consumption of ATS continue to rise, in contrast with current overall trends for plant-based drugs. Global seizures of ATS increased some threefold over the period 1998-2010, far more than the increases for plant-based drugs. The strongest increases in demand over the past decade have been reported in countries in Asia.

The consumption of drugs is a dynamic phenomenon, with users trying different combinations of drugs, sometimes mixing of legal and illegal drugs, as well as various modes of consumption. Polydrug use, or the use of various substances either simultaneously or sequentially, is reportedly increasing in many countries. While the most frequent substance combination is that of alcohol and various illegal substances, various illegal drugs, combinations such as “speedball”, a mix of cocaine and heroin, are also common in many places. High levels of non-medical use of prescription drugs are reported in many countries. The non-medical use of opioids is especially problematic, with overdose deaths involving prescription opioids having quadrupled since 1999 in the United States.

**Which factors shape the evolution of the problem**

The evolution of the complex global illicit drug problem is clearly driven by a range of factors. Sociodemographic trends, such as the population’s gender and age balance and the rate of urbanization, are influential. If the demographic profile of a given society changes, drug use behaviour may also change accordingly. Socioeconomic factors, such as levels of disposable income, inequality and unemployment, also play a role. Increased levels of disposable income may enable a larger number of people to buy illicit drugs, whereas high levels of inequality or unemployment may increase the propensity to use illicit drugs among those affected. A broad sociocultural category of drivers — including changes to traditional value systems and the emergence of a relatively uniform “youth culture” in many countries — also influences the evolution of the problem, though in ways that are often challenging to quantify. Analysis also shows that the availability of and perceptions of the inherent dangers of drugs are key variables in shaping drug use.

The international drug control system and its implementation have had a decisive influence on the evolution of the drug problem. A broad range of social and political events, generally unforeseeable and seemingly not connected to drug-related issues, have also fundamentally altered the drug problem that the world is faced with today. Events such as the war in Viet Nam, as well as broader and more profound transformations, such as those taking place at the end of the cold war, all impacted indirectly but significantly on the situation with regard to illicit drug use.

**How is the drug problem likely to evolve in the future**

One key development to monitor will be the ongoing shift away from developed to developing countries, which would mean a heavier burden for countries relatively less equipped to tackle it. Demographic trends suggest that the total number of drug users in developing countries would increase significantly, owing not only to those areas’ higher projected population growth, but also their younger populations and rapid rates of urbanization. Moreover, the gender gap may start closing as developing countries are likely to experience higher levels of female drug use in the wake of disappearing sociocultural barriers and increasing gender equality.

In terms of specific substances, the prominence of heroin and cocaine in illicit drug markets may continue to decline. In contrast, there are no signs that the popularity of cannabis is going to decrease significantly. Cannabis is likely to remain the most widely used illegal substance, and the use of a broader range of licit and illicit synthetic drugs is likely to continue to increase. These forecasts hinge on the assumption that key factors will remain unchanged. This assumption may not necessarily hold, as a number of unforeseen and largely unforeseeable events and circumstances may still occur and influence the problem, as has repeatedly happened in the past. The further one looks into the future, the more unpredictable the evolution becomes.

What can be said for sure is that Governments and societies will continue to face different policy choices when tackling drug-related and crime-related problems while securing international peace and development and upholding human rights.
